Executive Summary

The analysis investigates the key factors influencing consumer purchase decisions for wireless speakers using survey responses from over 5,000 participants. After filtering for respondents who currently own a wireless speaker, approximately 3,600 responses were analysed to better understand how owners evaluate price and what factors shape their purchasing behaviour.

The analysis revealed that price is the most important factor users consider when purchasing a wireless speaker. However, deeper analysis of the open-ended responses shows that price is not evaluated in isolation. Instead, users assess whether the price reflects the **product's quality**, **features**, **brand reputation**, and the **credibility of reviews** associated with speakers.

Thematic analysis identified five recurring themes that influence price perception: **product quality, budget considerations**, **product features**, **brand reputation**, and **online reviews**. Among these factors, budget considerations consistently emerged as the dominant theme across all age groups, indicating that users typically evaluate speakers within a defined price range before considering additional attributes.

The findings suggest that while competitive pricing remains important, successful products are positioned around clear value communication. Emphasising sound quality, durability, features, and positive customer reviews can strengthen users' perception that a product justifies its price and ultimately influence purchase decisions.

Project Objective

The goal of the analysis is to identify the key factors consumers consider when purchasing wireless speakers and understand how price perceptions influence buying decisions.

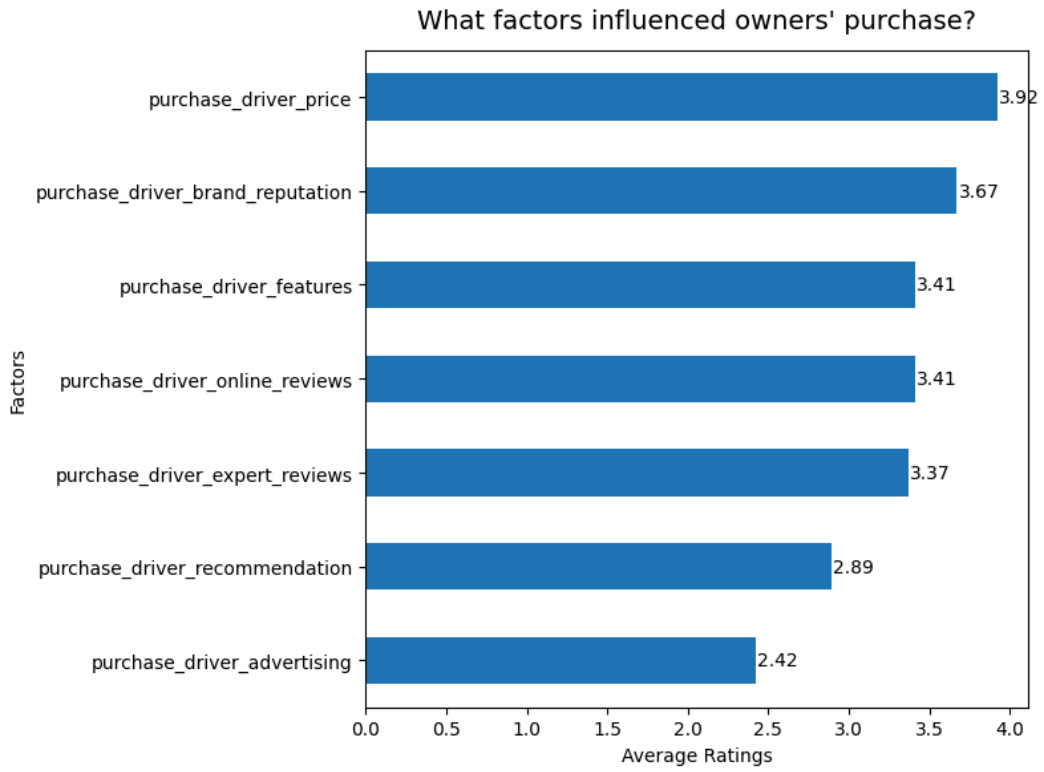
Data Overview

The dataset contained over 5,070 survey responses. After filtering for respondents who own wireless speakers, approximately 3,600responses were analysed.

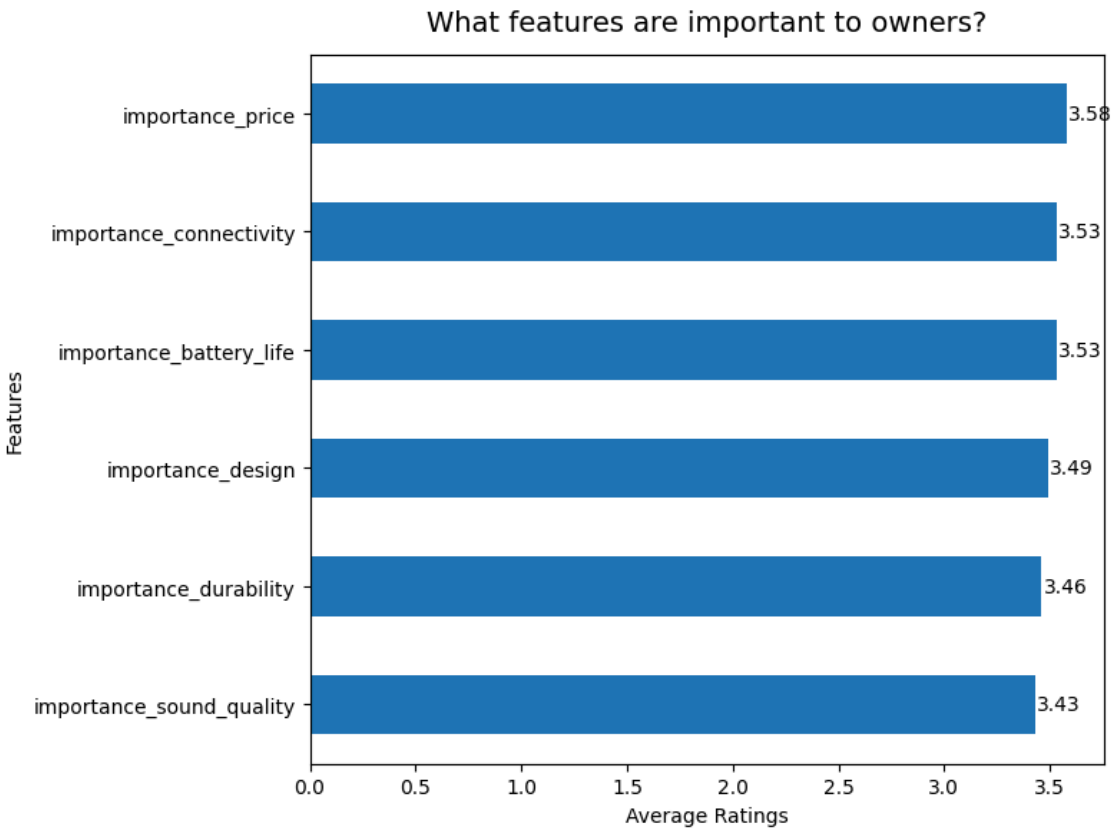
Observations

Observations based on purchase drivers and price evaluation.

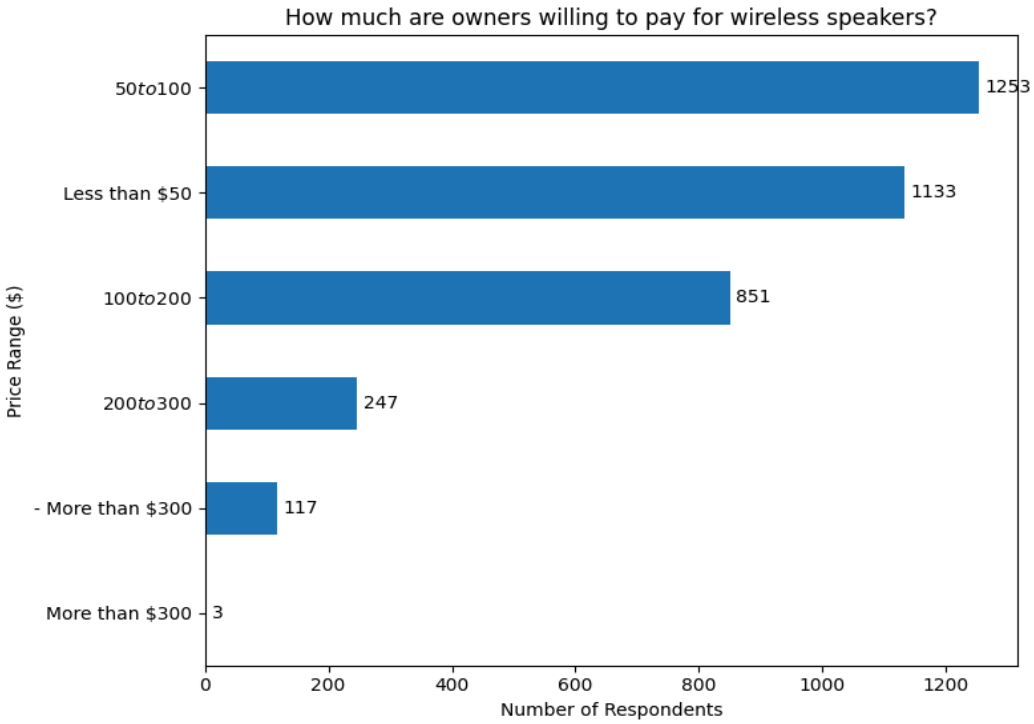
Price is the strongest factor influencing purchase decisions, with an average mean score of 3.92, followed by brand reputation at 3.67, and product features at 3.41. Online and expert reviews also play meaningful roles, while recommendations from friends and family and advertising have a comparatively smaller influence.



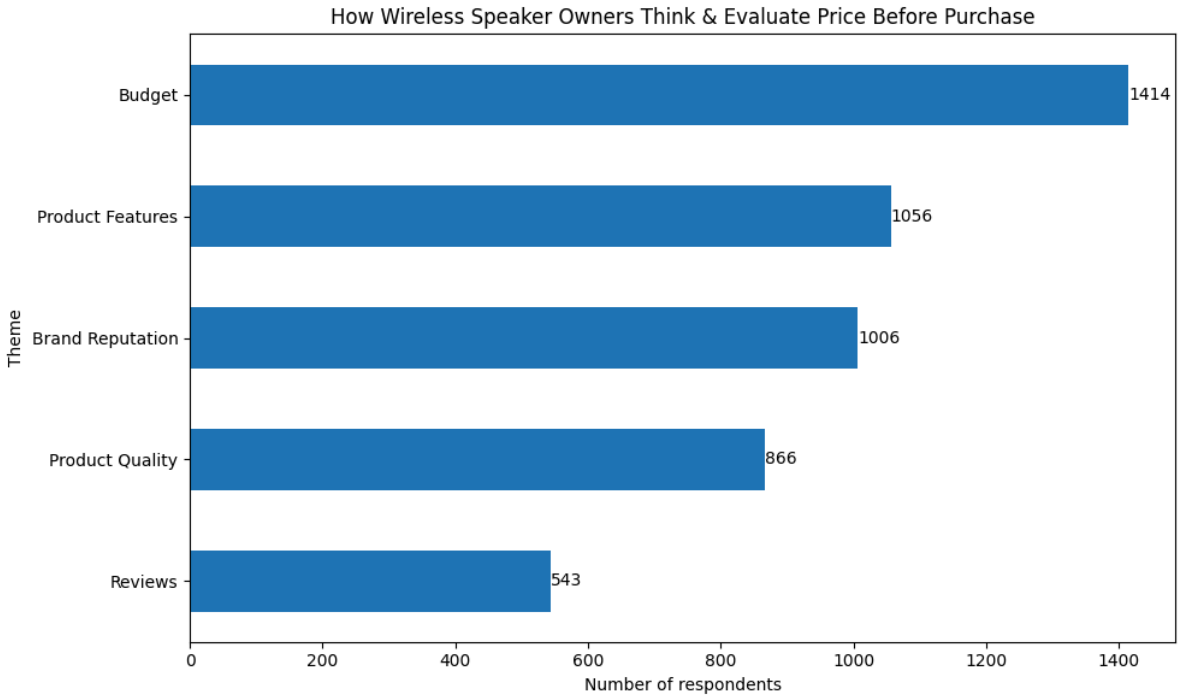
Users consider price, connectivity options, and battery life to be the most important features when making a purchase. Sound quality, design, and durability rank lower than these core functional attributes.



Most users are willing to spend between **$50 and $100**, followed closely by those willing to spend less than $50. Only a small minority are willing to pay more than $200.

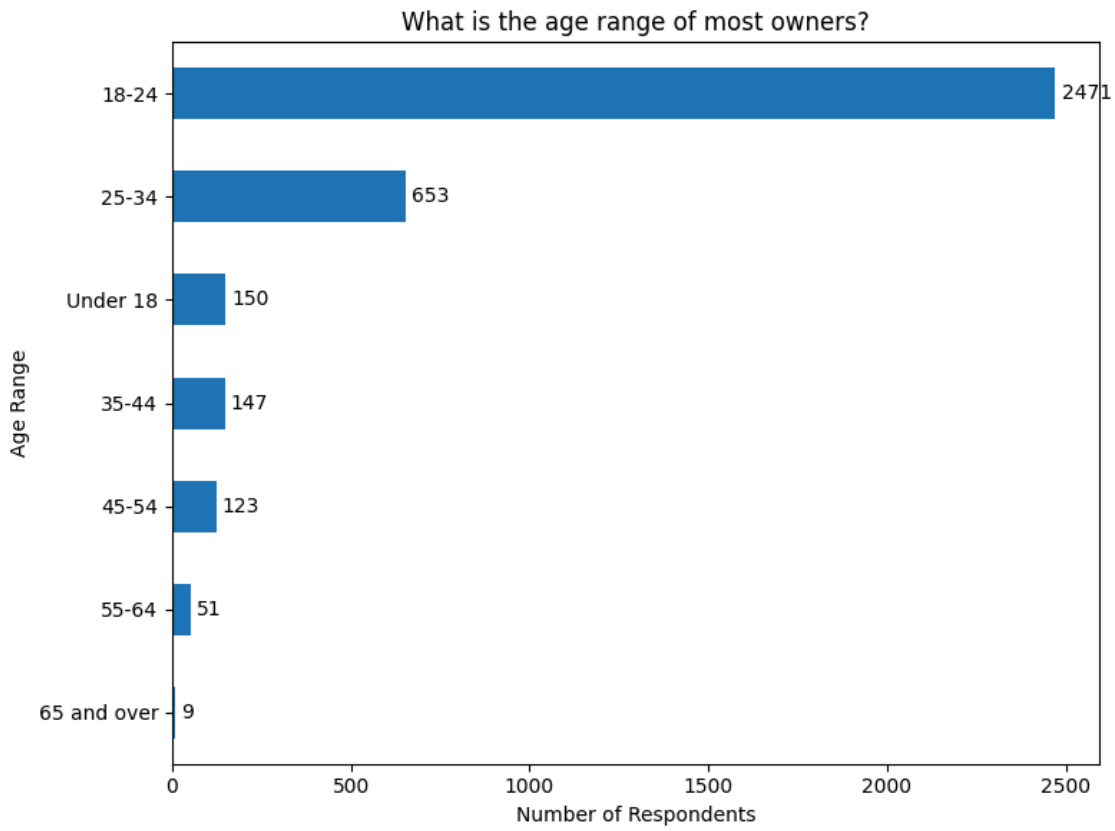


Budget considerations dominate how consumers evaluate price, followed by product features and brand reputation. This indicates that consumers often start with a budget constraint before assessing whether the product offers sufficient value.



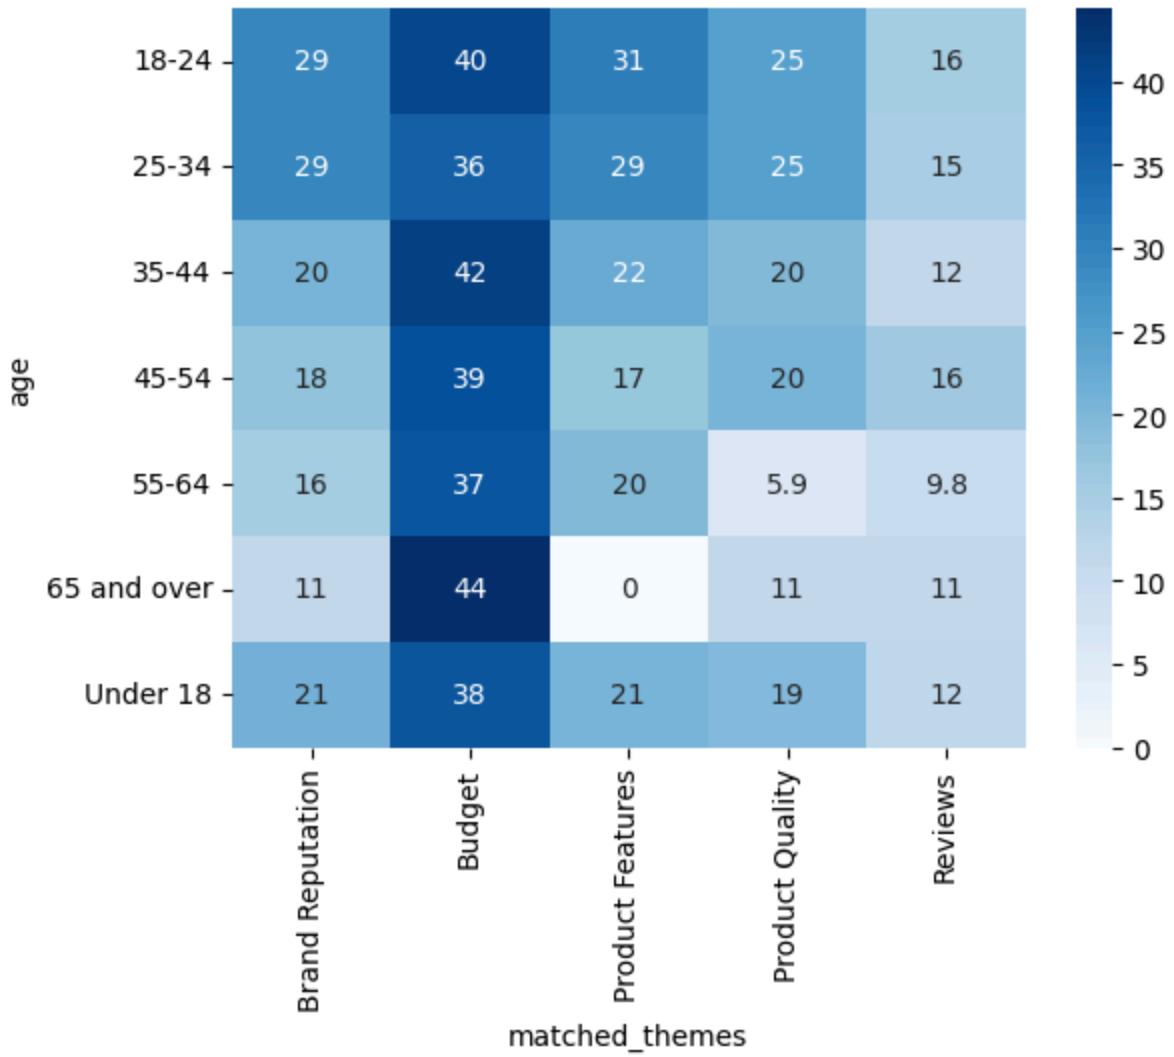
Observations based on customer profile.

Wireless speaker ownership is highly concentrated among younger consumers. The 18-24 age group represents the largest segment of owners, accounting for the majority of respondents. Ownership declines significantly in older age groups, suggesting that wireless speakers are primarily adopted by younger, more digitally engaged consumers.



Observation based on segmentation analysis

Budget considerations dominate price evaluation **across all age groups**, indicating that price sensitivity is consistent regardless of age. Younger consumers place slightly greater emphasis on product features and brand reputation, while older segments focus more narrowly on budget.



Conclusion based on Observations.

- Price is the most influential factor in wireless speaker purchase decisions. Across multiple analyses—including purchase drivers, feature importance, and thematic analysis
- Consumers evaluate price primarily within the context of their personal budget. Budget considerations appear to be the first filter consumers apply before evaluating other attributes such as product features, brand reputation, or product quality.
- Product features and brand reputation act as secondary decision drivers. While affordability is critical, consumers also assess whether the speaker offers sufficient functionality and comes from a reputable brand before committing to a purchase.
- Most consumers operate within a mid-range price expectation. The majority of respondents indicated a willingness to pay between $50 and $100, suggesting this range represents the most competitive segment of the wireless speaker market.

- Purchase behaviour is largely consistent across age groups. The heatmap analysis shows that budget considerations remain the dominant factor across all demographic segments, indicating that price sensitivity is broadly shared regardless of age.
- Younger consumers represent the largest segment of wireless speaker owners. The age distribution analysis shows a strong concentration of ownership among individuals aged 18–24, highlighting this demographic as the core market for wireless speakers.
- Consumers rarely evaluate price in isolation. Instead, price perception is shaped by a combination of factors, including product features, brand reputation, and perceived product quality.

Recommendations

- Since price is the most important purchase driver, highlight how the product's sound quality, battery life, and features justify the price to reinforce the perception of value.
- Prioritise product offerings between $50 and $100, as it appears to represent the largest and most competitive segment of the market.
- Marketing communication should highlight key functional features that demonstrate why the product offers strong value for money.
- Invest in brand positioning and reputation-building strategies to increase consumer confidence and justify premium pricing.
- Focus marketing campaigns and product positioning toward younger consumers through digital channels and lifestyle-oriented messaging.

Next Steps

Investigate feature preferences in greater detail.

- Additional research could explore which specific product features (e.g., battery life, connectivity, durability) most strongly influence willingness to pay.
